

Delivering the payment security your customers deserve — every moment, every day

\$579.4B USD

2025 global fraud losses from bank fraud and scams¹

Fraud is becoming faster, smarter and more difficult to detect. AI-powered attacks, the growth of real-time payments, and evolving regulatory demands are outpacing traditional fraud solutions. Built for the speed and complexity of modern payments, **INETCO BullzAI**® transforms every transaction into real-time fraud-fighting intelligence that helps financial institutions and payment service providers detect, prevent and investigate fraud before damage is done. Protect your customers, stay compliant and reduce fraud losses — all without compromising the payment experience.

~45%

<20ms

Fraud detection and blocking

~30%

Higher detection rate for new threats

~98%

Reduction in investigation time

Representative customer results. Actual results may vary.

From detection to investigation. All in one platform.

DETECT

Real-time transaction monitoring instantly detects new and evolving threats across all payment types and channels. Every in-flight transaction is decoded and correlated end-to-end, uncovering rich transaction intelligence without added latency, in-line instrumentation or payment switch modifications.

PREVENT

Self-training machine learning models continuously adapt to the unique behavior of each customer, card, device and terminal, refining after every transaction to identify behavioral drift before it evolves into known fraud patterns. Integrated case management and automated workflows accelerate investigations while maintaining a complete audit trail.

SHIELD

A containerized, AI-powered transaction firewall blocks fraudulent in-flight transactions with precision at the message field level, reducing false positives and approving more legitimate transactions. Zero-day threats and high-velocity attacks, including BIN attacks, card testing and DDoS campaigns, are blocked or rate-limited before authorization and fraud loss occur.

INVESTIGATE

Agentic AI fraud agents help fraud teams keep pace with growing investigation volumes without increasing headcount. Automated alert triage, explainable risk scoring and high-risk case prioritization focus investigators on the threats that matter most. Human-in-the-loop learning continuously improves performance, while a proprietary on-premise small language model keeps sensitive data secure within your environment.

Why INETCO BullzAI

See more, detect more.

Decode every message field and correlate every end-to-end transaction link in real-time, uncovering risk indicators and blind spots other solutions miss.

Protect against new and evolving threats

Monitor every in-flight transaction from initiation through authorization to detect and prevent fraud in milliseconds before damage is done.

Minimize false positives

Reduce false positives and first-line investigation effort with individualized behavioral models, transaction-level blocking and AI-assisted investigations.

Stop fraud before losses occur

Stop attacks before they complete and investigate incidents faster to reduce financial losses, repayment costs and operational overhead.

Investigate smarter and faster

Agentic AI agents triage alerts, prioritize high-risk cases and deliver explainable risk scores, accelerating fraud investigations from 10-30 minutes to ~20 seconds with recommendation accuracy of approximately 95%.

Maximize customer security and satisfaction

Approve more legitimate transactions while surgically blocking confirmed fraud, protecting customers without disrupting their experience.

Strengthen compliance

Monitor and analyze every payment across all channels in real time to support cyber, fraud and AML compliance — with a complete, verifiable audit trail.

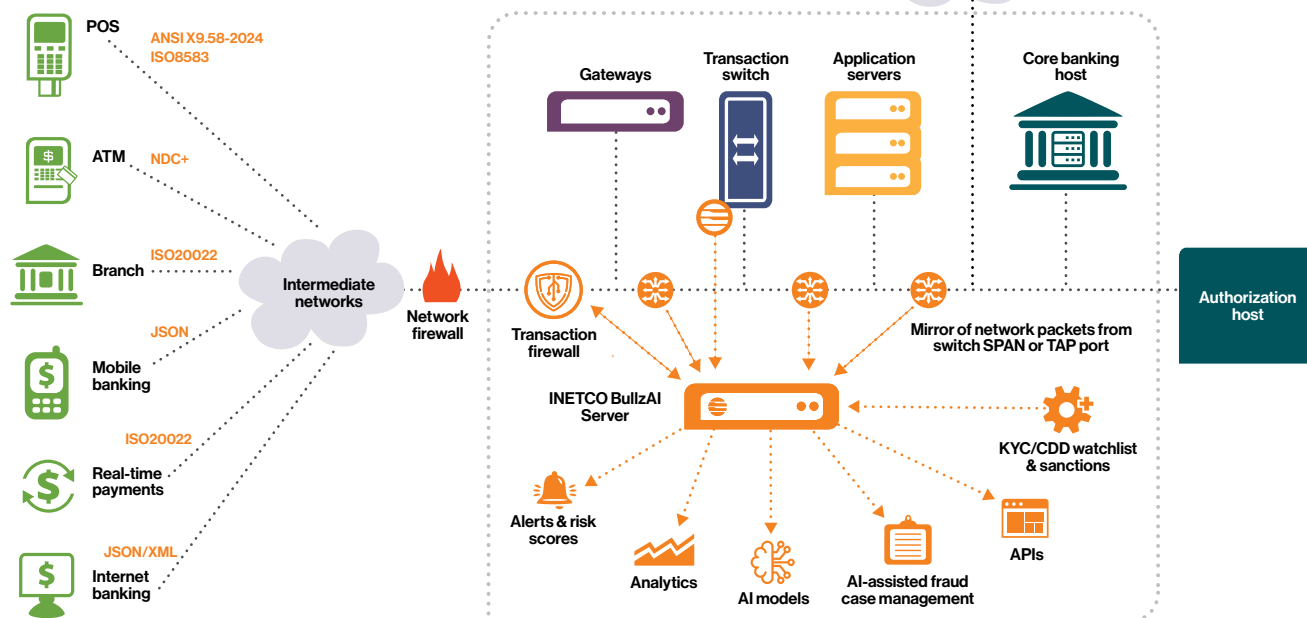

One model per entity — not one for all

Establish unique, unbiased behavioral baselines for every user, card, device and terminal, continuously refined after every transaction.

Detect and block multi-vector attacks in milliseconds

DIAGRAM: Uncover fraud patterns other systems miss with end-to-end transaction lifecycle visibility. INETCO BullzAI passively captures mirrored network traffic from switch SPAN or TAP ports to decode and correlate every transaction in real time without agents, production changes or performance impact.
